FIELD TOMATO VARIETY TRIALS - 1964
Hoytville, Ohio

WALTER N. BROWN*

The 1964 field tomato variety trials included twenty-four varieties replicated five times (Table 1), and twenty-eight varieties in single plots (Table 2).

Cultural Information

Plants: Greenhouse and frame-grown, 70 per standard flat from seed sown April 7.

Transplanted to field: May 22, with single row transplanter, using 10-52-17 starter at rate of 3 lbs/50 gal. of water.

Fertilizer: 1000 lbs/A of 5-20-20 drilled and disked in after plowing down approximately 10-12 tons/A of feedlot manure, with 2-yr. alfalfa sod. No side-dressings were used.

Plot Size and Spacing: Twenty plants per single row plot, spaced 2' in row and 5' between rows, with the exception of varieties 46a and b and 47a and b, which were spaced 1' in row with two varieties per 40' of row.

Insect and Disease Control: Dieldrin for flea beetles on May 26, seven applications, alternating Manzate and Copper A first applied on July 2, and last on Sept. 17, at approximately 10-15-day intervals depending on the weather. One-fourth pound of Dieldrin was applied on Sept. 2 for cricket control.

Weather Data: Temperatures were generally slightly above normal throughout the season with the exception of August, which was slightly below normal. Rainfall was generally below normal with the exception of August which registered 1.18" above normal. However, the distribution was such that maximum benefit was not obtained from rain that fell. It was distributed so that the maximum falling in any period was generally less than 0.75". After a prolonged period of near drought conditions, 0.73" occurred and caused considerable bursting and skin cracking. Fruit set was generally good and better than average, but fruit size was small and yields were approximately 1/2 of normal. Average temperatures and rainfall recorded during the growing periods were as follows:

	<u>Average Temperature</u>	<u>Rainfall</u>
June	70.6° F. near normal	2.27"-0.84" normal
July	74.4° F. +0.90° normal	1.59" -2.43" normal
August	69.3° F. -0.60° normal	2.99" + 1.18" "
September	65.5° F. +0.60° normal	1.76" - 1.08" "

Harvest Information

The first harvest was made on August 18 and the last on October 5. All fruits were graded on the basis of U.S. No. 1, No. 2 for defects, No. 2 for color, and culls. These grades are recorded as percentages of total weight for each individual harvest period and for the season's yield. Each fruit was classified as wither cracked or not cracked, and the percentage of cracked fruits computed with no attempt being made to classify the fruits as to extent or kind of cracking. The yields are recorded in Tables 1 and 2 according to:

Early-Aug. 18 and 25; Midseason - Sept. 2 and 8; Late - Sept. 21 and Oct. 5; and Total - for the entire six harvests. A killing frost occurred during the night of October 5-6 damaging all fruits. Varieties are ranked in Tables 1 and 2 in order of early yield.
